

Revision to Inventory of Hospital Services  
May 28, 2008

Due to the omission of Oncology patients from Medical-Surgical/Pediatric patient migration data in the originally-published Inventory of Hospital Services, the Medical-Surgical/Pediatric section of the Inventory has been re-calculated and re-published with the inclusion of Oncology patients. The re-published Medical-Surgical/Pediatric section reflects all Board actions and bed changes which have occurred to date.

## Planning Areas for Medical-Surgical/Pediatrics, Obstetrics/Gynecology, and Intensive Care Categories of Service

**Process for Calculation of Beds Needed - Hospital Categories of Service**

For the Medical-Surgical/Pediatrics category of service:

1. 40 Medical-Surgical/Pediatrics planning areas have been designated by the Health Facilities Planning Board as illustrated on the preceding page and the pages which follow.

2. Occupancy target rates:

Modernization:

Medical-Surgical

1-25 beds	60%
26-99 beds	75%
100-199 beds	85%
200+ beds	90%

Additional Beds:

Medical-Surgical

1-99 beds	80%
100-199 beds	85%
200-+ beds	90%

Pediatrics

1-30 beds	65%
31+ beds	75%

Pediatrics

1-99 MS beds	80%
100-199 MS beds	85%
200+ MS beds	90%

3. Bed need for Medical-Surgical/Pediatrics is calculated by first calculating a three-year average utilization of Medical-Surgical/Pediatrics services in the area for three age groups: 0-14 years, 15-64 years, and 65+ years. These age group average utilizations are divided by the planning area base year population estimate for each age group to produce age group utilization rates. The age group utilization rates are multiplied by the projected planning area populations for each age group ten (10) years from the base year to calculate projected patient days for each age group. These are added to produce a projected total Medical-Surgical utilization.

Next, a migration adjustment factor is calculated for the planning area. This is done by subtracting the number of patients from outside the planning area receiving services at area hospitals (in-migration) from the number of area residents receiving services at hospitals outside the planning area (out-migration). The difference between these figures is multiplied by the State average for length of stay for Medical-Surgical/Pediatrics patients to calculate migration patient days. This is multiplied by an adjustment factor of 0.50. If out-migration exceeds in-migration, the adjusted migration days are added to the projected patient days for the area. If in-migration exceeds out-migration, the adjusted days are deducted from the projected patient days for the planning area.

The migration-adjusted projected patient days for the planning area are divided by 365 (days in projection year) to find the projected Average Daily Census for Medical-Surgical /Pediatrics services for the planning area. The Average Daily Census is divided by the target occupancy rate for additional beds (determined by the number of Medical-Surgical/Pediatrics beds in the planning area, illustrated above) to calculate the projected number of medical-Surgical/pediatrics beds needed in the planning area.

For the Obstetrics/Gynecology category of service:

1. The planning areas are the same as those designated for Medical-Surgical/Pediatrics category of service.

2. Occupancy target rates:

1-10 Obstetrics beds in area	60%
11-25 Obstetrics beds in area	75%
26 or more Obstetrics beds in area	78%

3. Bed need for Obstetrics/Gynecology category of service is determined by first multiplying the fertility rate for the planning area by the projected female population of child-bearing age (15-44 years) ten (10) years from the base year to calculate projected planning area births, which are multiplied by 0.99 to adjust for births occurring in hospitals. This figure is multiplied by an average maternity length of stay of 2.5 days to calculate projected maternity patient days for the planning area.

The projected maternity patient days for the planning area are divided by 365 (days in projection year) to calculate a projected maternity average daily census, which is divided by the planning area target occupancy rate (determined by number of Obstetrics beds in the planning area, above) to determine the projected number of Obstetrics beds needed for maternity patients.

Next, the number of gynecology beds needed are calculated by first dividing the number of gynecology patient days by the planning area estimated female population aged 15+ to determine a gynecology use rate. This rate is multiplied by the projected planning area female population aged 15+ ten (10) years from the base year to calculate projected gynecology patient days for the planning area.. The projected patient days are divided by 365 to get the average daily census, which is divided by 0.9 to adjust for a 90% occupancy target to produce the projected number of Obstetrics beds needed for gynecology patients.

Next, an Obstetrics migration adjustment is calculated by subtracting the number of Obstetrics patients entering the planning area from outside from the number of planning area residents leaving the area to receive Obstetrics services in another planning area. This migration difference is multiplied by the average length of stay of 2.5 days to get migration patient days, then multiplied by a 0.85 adjustment factor to get adjusted migration days. The adjusted days are divided by 365 to produce the average daily migration census.

If there is net out-migration for Obstetrics/Gynecology services, the migration adjustment is added to the projected maternity beds needs and the projected gynecology beds needs to determine the adjusted Obstetrics bed need for the planning area. If there is net in-migration, the migration adjustment is subtracted from the sum of maternity and gynecology beds needed to determine the adjusted Obstetrics bed need.

For Intensive Care category of service:

1. The planning areas are the same as designated for Medical-Surgical/Pediatrics category of service.
2. The occupancy target rate is 60%.
3. Bed need is determined by first calculating the three-year average Intensive Care utilization for the planning area. This average utilization is divided by the total estimated planning area population to produce a use rate for the planning area. The calculated use rate is multiplied by the projected total population of the planning area ten (10) years from the base year to find the projected Intensive Care patient days for the area.

The projected patient days are divided by 365 (days in projection year) to calculate the projected average daily census for Intensive Care services. The projected average daily census is divided by 0.6 (60% occupancy target utilization rate) to calculate the projected number of Intensive Care beds needed in the planning area.

Data Sources:

- 2005 population estimates prepared by Illinois Center for Health Statistics. Illinois Department of Public Health
- 2015 population projections based upon the latest county-level numbers prepared by Illinois Department of Commerce and Economic Opportunity and tabulated or disaggregated to Illinois Health Facilities Planning Board health planning areas by the Illinois Center for Health Statistics, Illinois Department of Public Health
- 2005 health services utilization rates are based upon data provided by health care facilities in response to the Annual Hospital Questionnaire, administered by the Illinois Department of Public Health
- 2005 fertility rates based upon Illinois Vital Statistics data as tabulated by the Illinois Center for Health Statistics, Illinois Department of Public Health
- 2005 hospital patient migration is based upon hospital discharge data collected by the Office of Policy, Planning and Statistics, Illinois Department of Public Health

**COMPREHENSIVE PHYSICAL  
REHABILITATION  
Category of Service**

## Planning Areas for Comprehensive Physical Rehabilitation Category of Service

For the Comprehensive Physical Rehabilitation category of service:

1. The planning areas are the designated Health Service Areas.
2. The target occupancy rate is 85% utilization..
3. Bed need for Comprehensive Physical Rehabilitation is calculated by first determining the State minimum utilization rate. This is calculated by dividing the state total patient days for Comprehensive Physical Rehabilitation by the State estimated total population to get an overall use rate. This overall rate is multiplied by 0.6 (60%) to establish the minimum utilization rate.

The actual utilization rate for the planning area is calculated by dividing area patient days for Comprehensive Physical Rehabilitations by the planning area total estimated population. The area use rate is compared to the State minimum use rate; the planned use rate is the greater of the two.

The planned use rate is multiplied by the area projected total population ten (10) years from the base year to calculate the projected patient days for the planning area. The patient days are divided by 365 to find the Average Daily Census, which is divided by 0.85 (85% utilization target) to determine the projected number of Comprehensive Physical rehabilitation beds needed in the planning area.

**Category of Service**

## Planning Areas for Acute Mental Illness Category of Service

For the Acute Mental Illness category of service:

1. The planning areas are Health Service Areas 1, 2, 3, 4, 5, 10 and 11. For the area covered by Health Service Areas 6, 7, 8, and 9, the planning areas are the Medical-Surgical/Pediatrics planning areas A-01 through A-14.
2. Occupancy target is 85% utilization.
3. Bed need for Acute Mental Illness is calculated by first multiplying the projected planning area population ten (10) years from the base year by a minimum bed rate of .11 per 1,000 population to establish the minimum number of Acute Mental Illness beds needed in the planning area.

Next, the actual utilization rate is calculated by dividing the area patient days by the area total estimated population. This actual use rate is multiplied by the projected area population ten (10) years from the base year to find projected patient days. This patient days figure is divided by 365 to determine Average Daily Census, which is divided by 0.85, to factor in the 85 percent target utilization rate, to arrive at projected beds needed.

The planning area Acute Mental Illness bed need is the greater of the calculated minimum bed need and the projected bed need based on actual utilization figures. The planned use rate is multiplied by the projected area population to find projected patient days. The patient days are divided by 365 to calculate Average Daily Census, which is divided by 0.85 (85% utilization target) to project the number of Acute Mental Illness beds needed

**OPEN HEART SURGERY**  
**Category of Service**

## Planning Areas for Open Heart Surgery Category of Service

For the Open Heart Surgery category of service:

1. The planning areas are the designated Health Service Areas
2. Utilization standards:
  - Adult - minimum of 200 open heart procedures per year within 3 years of start-up.
  - Child - minimum of 75 open heart procedures per year within 3 years of start-up.

3. Need for additional open heart surgery services is determined by at least 200 patients per year referred to other open heart surgery services following cardiac catheterization at the applicant facility or a minimum of 750 cardiac catheterizations performed per year at the applicant facility.
